

proposed site conditions

On site topography will be altered to have drainage towards center of site. All slopes will not exceed a slope of 25% so large equipment can be used onsite. Swales will be placed to drain into ponds. All swales will have a 6% slope and will not exceed a slope of 8%. An additional pond will be located near the brewery for retention and use. Existing pond has to be modified to maintain a low point beneath swale. Existing evergreen tree line will be maintained and existing topography nearby will not be disturbed. Onsite structure materials will be reused for new structures. Site entrance will be relocated to the low point on site. All site structures will be installed in the proposed valley. Removed tree line will be used for planting beds and new structures.
