

Site

The site designs starts when the visitor turns into the entrance of the site. By creating a layer of trees as the initial approach to the buildings it not only allows for light to be introduced into certain areas but it sets up a pattern that can allow for roads to cabins or future sites and roads for access to mushroom growing areas.

Building

Once the user passes through the trees another landscape element is used to bring people into the buildings. By forming the land around the building it makes the user go through the land to enter into the built environment. This sets up the rest of the land to be more integrated with the land and earth.

Farm

As the buildings are more developed the filtration of people from the beginning to the end of the property will become clearer. There are many aspects of the site that will influence the design of the building and many aspects of the building that will further influence the site.
